

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

1. (original): A method of remotely monitoring an exchange of data between a local computer and a remote computer during an Internet session over the Internet, the method comprising the steps of:

- (a) storing at a local computer an Internet server address and port number of a monitor computer;
- (b) initiating a first Internet session between the local computer and a remote computer via the Internet;
- (c) storing at the local computer data associated with the first Internet session;
- (d) retrieving the Internet server address and port number stored at the local computer;
- (e) initiating concurrent with the first Internet session a second Internet session between the local computer and the monitor computer at the retrieved Internet server address and port number;
- (f) transmitting from the monitor computer to the local computer at least one of another Internet server address and another port number;
- (g) terminating the second Internet session;
- (h) initiating concurrent with the first Internet session a third Internet session between the local computer and the monitor computer using the other Internet server address and/or the other port number; and
- (i) transferring from the local computer to the monitor computer via the third Internet session the stored data associated with the first Internet session.

2. (original): The method as set forth in claim 1, wherein:
step (c) includes storing the data associated with the first Internet session in a memory of the local computer; and

step (i) includes transferring the data stored in the memory to the monitor computer.

3. (original): The method as set forth in claim 1, further including at least one of the steps of:

displaying on a display of the monitor computer the transferred stored data associated with the first Internet session; and

storing at the monitor computer the transferred stored data associated with the first Internet session.

4. (original): The method as set forth in claim 1, wherein the data associated with the first Internet session includes data previously displayed on a display of the local computer.

5. (original): The method as set forth in claim 4, further including the step of:

(j) transferring from the local computer to the monitor computer in real-time via the third Internet session data displayed on a display of the local computer and associated with the first Internet session.

6. (original): The method as set forth in claim 5, further including the steps of:

causing the local computer to terminate real-time transferring of data to the monitor computer via the third Internet session; and
terminating the third Internet session.

7. (original): The method as set forth in claim 1, wherein:

the local computer determines a first check sum of the stored data and transfers the first check sum with the stored data;

the monitor computer determines a second check sum of the transferred stored data; and

in response to detecting a match between the first and second check sums, the monitor computer displays on a display of the monitor computer the transferred stored data and/or stores the transferred stored data.

8. (original): The method as set forth in claim 1, wherein:

the local computer transfers with the transferred stored data the time the stored data is transferred to the monitor computer; and

the monitor computer stores with the transferred stored data the time the stored data is transferred to the monitor computer.

9. (cancelled)

10. (currently amended): ~~The method as set forth in claim 9~~ A method of remotely monitoring an Internet session, the method comprising the steps of:

(a) participating in a first Internet session at a first Internet protocol (IP) address;

(b) concurrent with the first Internet session, initiating another Internet session at another IP address; and

(c) transferring data associated with the first Internet session to the other IP address via the other Internet session, wherein steps (a), (b) and (c) are performed at the same user computer, wherein step (b) includes the steps of:

initiating a second Internet session at a second IP address;
receiving from the second IP address via the second Internet session a third IP address;
terminating the second Internet session; and
initiating a third Internet session at the third IP address.

11. (original): The method as set forth in claim 10, wherein step (c) includes the step of transferring data associated with the first Internet session to the third IP address via the third Internet session.

12. (currently amended): The method as set forth in claim 910, wherein the data associated with the other Internet session includes at least one of (i) data previously displayed in connection with the first Internet session and (ii) data displayed in real-time in connection with the first Internet session.

13. (currently amended): The method as set forth in claim 910, further including at least one of the steps of:

displaying the transferred data; and
storing the transferred data.

14. (currently amended): The method as set forth in claim 910, further including the steps of:

terminating the transfer of the data to the other Internet session; and
terminating the other Internet session.

15. (currently amended): ~~The method as set forth in claim 9, further including the steps of:~~
A method of remotely monitoring an Internet session, the method comprising the steps of:

(a) participating in a first Internet session at a first Internet protocol (IP) address;
(b) concurrent with the first Internet session, initiating another Internet session at another IP address;

(c) transferring data associated with the first Internet session to the other IP address via

the other Internet session, wherein steps (a), (b) and (c) are performed at the same user computer;

- (d) determining a first check sum for the data associated with the first Internet session;
- (e) transferring the first check sum to the other IP address via the other Internet session with the data associated with the first Internet session;
- (f) determining a second check sum for the transferred data associated with the first Internet session; and
- (g) in response to detecting a match between the first and second check sums, displaying and/or storing transferred data.

16. (currently amended): The method as set forth in claim 9~~10~~, further including the steps of:

- applying a time-stamp to the data associated with the first Internet session; and
- transferring the time-stamp to the other IP address via the other Internet session with the data associated with the first Internet session.

17. (previously presented): A method of remotely monitoring an Internet session, the method comprising the steps of:

- (a) receiving at a second Internet protocol (IP) address via a second Internet session therewith a request to monitor a first Internet session occurring at a first IP address;
- (b) transmitting from the second IP address via the second Internet session a third IP address;
- (c) initiating a third Internet session at the third IP address; and
- (d) transferring data associated with the first Internet session to the third IP address via the third Internet session, wherein:

the first Internet session is between a local user computer and a remote user computer residing at the first IP address;

the second Internet session is between the local user computer and a monitor computer residing at the second IP address; and

the third Internet session is between the local user computer and a computer residing at the third IP address.

18. (original): The method as set forth in claim 17, wherein the data associated with the first Internet session includes at least one of (i) data previously displayed in connection with the first Internet session and (ii) data displayed in real-time in connection with the first Internet session.

19. (original): The method as set forth in claim 17, further including at least one of the steps of:

displaying the transferred data; and
storing the transferred data.

20. (original): The method as set forth in claim 17, wherein each IP address includes at least one of a unique server address and unique a port number.

21. (previously presented): The method as set forth in claim 17, wherein the computer residing at the third IP address is the monitor computer.

22. (cancelled)
